

HI ALL AND THANKYOU FOR DOWNLOADING IBOPLAYER FROM
APPSNSCRIPTS.COM

to get started you'll need some type of lib/hex editing software i'd highly recommened a windows pc/laptop with apkeasytool and notepad++

APK EDITOR WILL NOT WORK WITH THIS AS YOU CAN NOT EDIT LIBS ON THAT

Decompile the apk and locate the following:

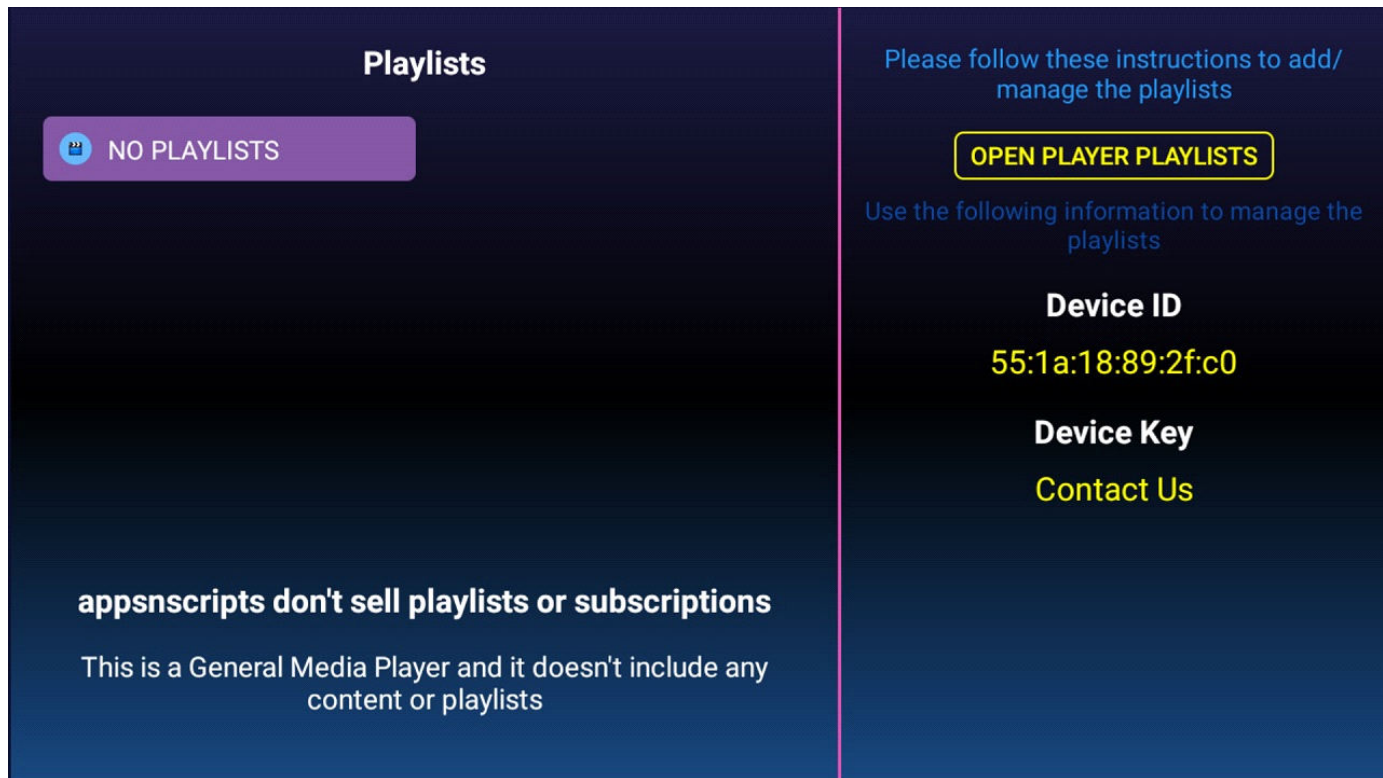

```
lib>arm64-v8a>libgojni.so
```

```
lib>armeabi-v7a>libgojni.so
```

```
lib>x86>libgojni.so
```

```
lib>x86_64>libgojni.so
```

search for the following... <https://yourhost.xyz/yourfolder/> and replace with your hostname and foldername this is 32 characters exactly including the https and / on the end of url it is importantg that you match this with your hosting if you don't the app will fail... there is two locations in each libgojni.so making that 8 in total once you've done that save and rebuild apk with your chosen editor if done successfully you should be greated with this screen on the app

Now if your successful with rebuilding apk the panel comes into play

enter the device ID on the right all in caps into the users section on the panel followed by username,password and dns for the choosen iptv service http and https are supported... expire date is for the mac address however i just put this as my customers details expiry date submit it and force close the app you should then be greated with a similar screen but this time with a playlist click onto that and boom your in!
